			49	A29	A2

all other odd pins GROUND

All signals correspond to the expansion bus of the IBM PC. The xIO CH CK signal is not implemented in the ATARI PC. The connectors do not provide any of the power supply voltages. Also note that the CLK signal is the processor clock, and so in the ATARI PC may be either 4.77 MHz or 8.0 MHz depending upon the "turbo" mode bit.
